FOR IMMEDIATE RELEASE

Century Controls Announces CC-6000 Enhancements *Touch Screen Display and Remote Communications*

ROGERS, Minnesota — November 16, 2009 — Century Controls proudly announces major upgrades to the CC-6000 Air Compressor Master Control!

NEW!

- **Color Touch Screen Displays**
- **Remote (Ethernet) Access and Management**
- **Communications Interfaces (BACnet, Modbus, LON, etc.)**
- **Multi-Level Password Protection**
- **Email Reporting of System Alarms**
- **Allows Digital Scheduling Inputs for Pressure Set-Back**

The CC-6000 has always delivered smart coordination of multiple air compressors to help owners reduce both electricity consumption and equipment wear. Now with 6”, 8” or 10” color touch screen displays, users have a dramatically improved interface. These displays allow remote access from any internet connection to allow users to both monitor the system and change set points. Additionally, communication gateways are available in all common protocols to capture operating results to allow for system trending and monitoring with your production management system. A redesigned menu structure, stronger password protection and email notification of alarms round out this “full-featured” control solution.

With the continuing increases in energy prices, it is imperative that compressed air users do everything possible to reduce energy consumption. The CC-6000 Air Compressor Master Control was designed by compressed air experts using a proven, patented *smarter* algorithm that reduce energy bills by allowing compressors to run only when needed, reducing on/off cycles and controlling load/unload decisions, all while maintaining a tight pressure output to match system load. We allow you take energy savings straight to the bottom line. The algorithm makes the difference in the amount of money saved.
